Dear SPANners,

This week we have added two new pages to the enrollment update. First, we have your Control Limit Graphs. You can see where your lesion size is (From Day 2 MRI) relative to the network control limits. Remember, this is a 7 day moving average, so it takes a while to update. Also, we only have data on mice—the rat pipeline is still under construction.

The other new table is in response to a problem Jessica noticed last week. In Stage 1, rather than report enrollment, I summarized randomizations; they were essentially the same thing in Stage 1. Now in Stage 2, however, enrollment is very different than randomization. For example, you enroll your obese mice 3 months prior to randomization and surgery. To allow for cross-stage comparisons, I will keep the graphs all based on randomizations. That way we can chart our progress using a consistent method. In addition, however, I have tabulated the enrollments and the surgeries by site and by model, so you have an accurate picture of your activities so far. Let me know what you think.

I will be taking a few days off this week and Francesca has kindly agreed to lead the steering committee meeting on Wednesday. I'll be back soon.

Best,

PL
